

Developing Applications with Containers

Microsoft Services

Module 4 - Microservices and Containers

Microsoft Services

Objectives

- What are Microservices?
- Microservices Patterns
- Microservices Real World Case Studies
- Microsoft Platform and Microservices
- Containers & Microservices
- Demo

Microservices Architecture

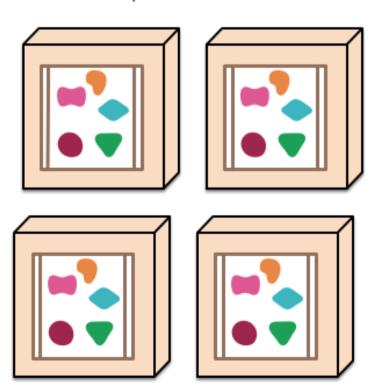

A monolithic application puts all its functionality into a single process...

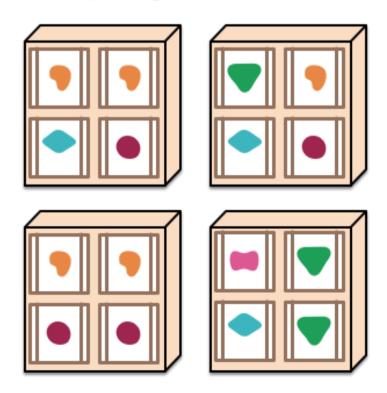

A microservices architecture puts each element of functionality into a separate service...

... and scales by replicating the monolith on multiple servers

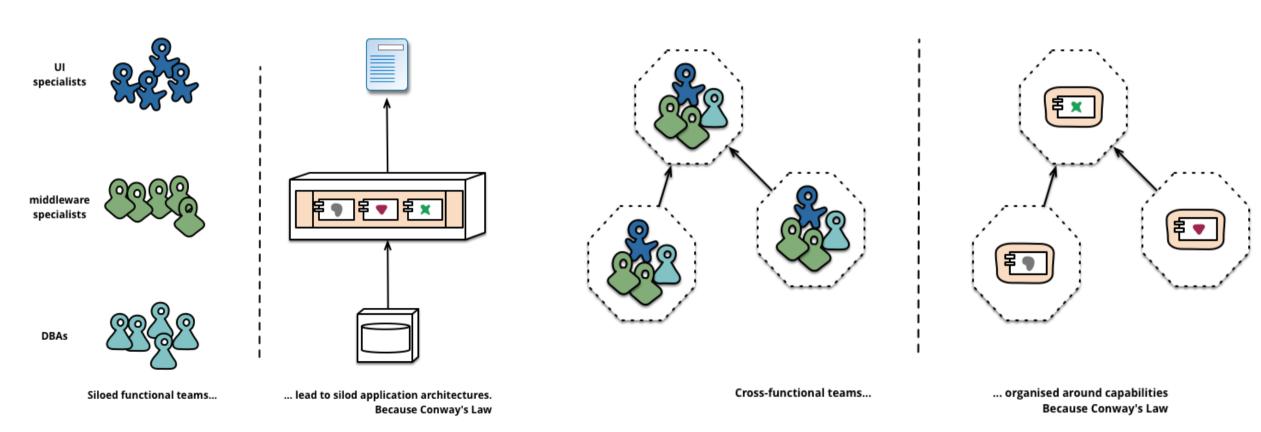

... and scales by distributing these services across servers, replicating as needed.

Microservices Architecture (Cont.)

"Any organization that designs a system (defined broadly) will produce a design whose structure is a copy of the organization's communication structure." -- Melvyn Conway, 1967

Monolithic

Microservices

SOA and Microservices

SOA

- Services are interfaces of a large monolith
- Orchestration is often required and tend to contain business logic
- Spans across the enterprise

Microservices

- Services are individually developed and deployed
- Does not require integration technology
- Logic resides in microservices
- Can be limited to an individual project

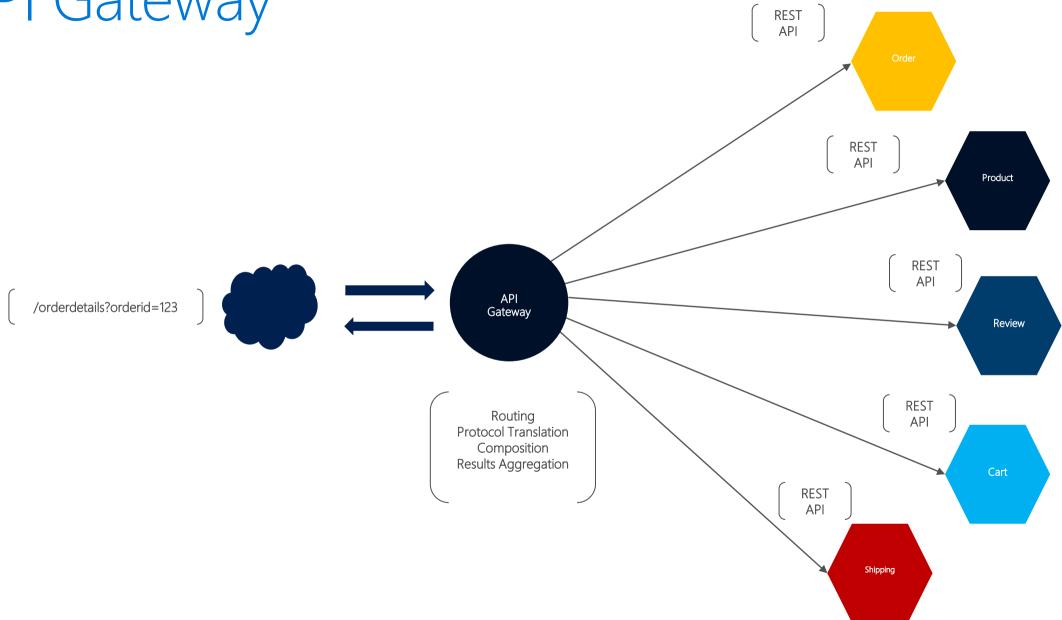

Microservices Design Patterns

Challenges this pattern solves:

- Granularity of services is often more fine grained than what clients would need
- Different type of clients need different data
- Protocol used by services differ greatly. E.g. AMQP, WebSocket etc.
- Partitioning of services should be hidden from the clients

Solution:

- API Gateway acts as an entry point for all access to Microservices by encapsulating the internal system design and provides:
 - API that is tailored for each client
 - Security features such as authentication, token cache etc.
 - Protocol transition
 - Load balancing

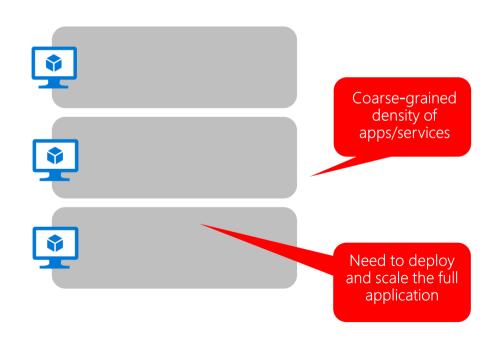

Microservices Design Patterns in Practice

Traditional application approach

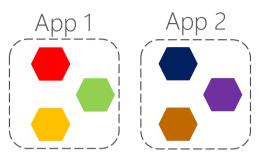

- A traditional application has most of its functionality within a few processes that are componentized with layers and libraries.
- Scales by cloning the app on multiple servers/VMs

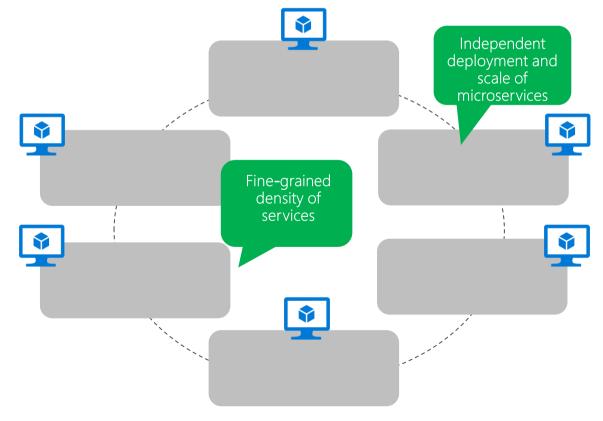

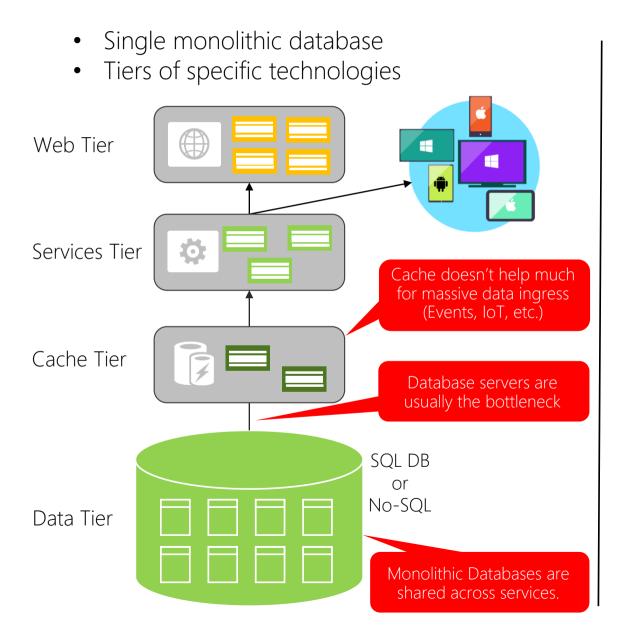

Microservices application approach

- A microservice application segregates functionality into separate smaller services.
- Scales out by deploying each service independently with multiple instances across servers/VMs

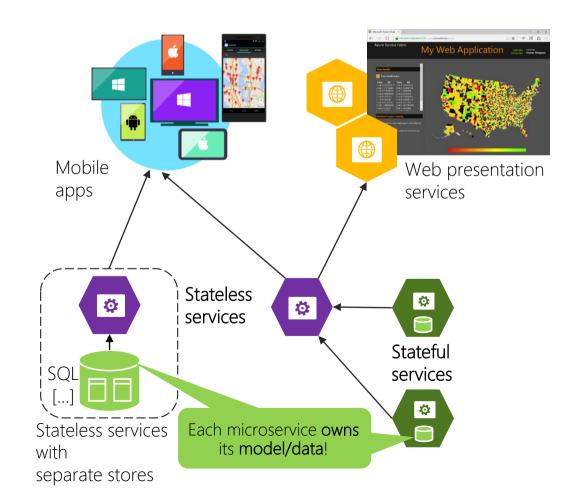

Data in Traditional approach

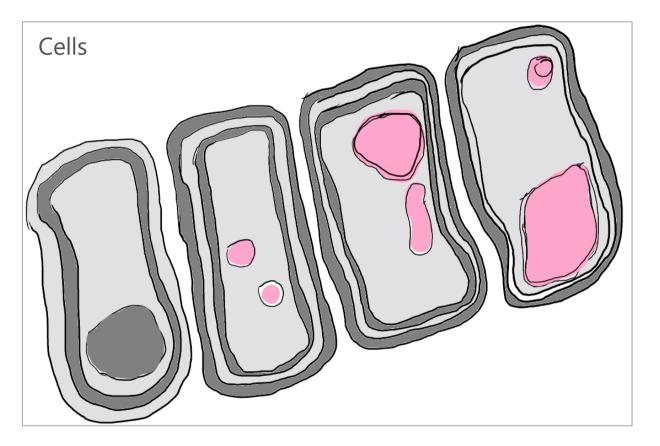

Data in Microservices approach

- Graph of interconnected microservices
- State typically scoped to the microservice
- Remote Storage for cold data

The Bounded Context Pattern

Independent Autonomous Loosely coupled composition

"Cells can exist because their membranes define what is in and out and determine what can pass" [Eric Evans]

Bounded Contexts and Microservices

Bounded Context == "Business Microservice" boundary

Each Bounded Context has:

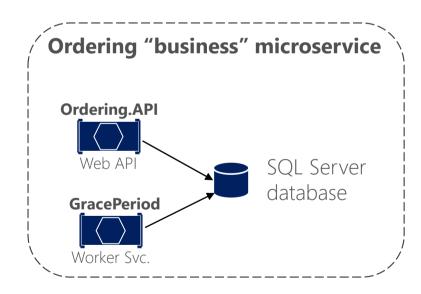

- Its own Domain Model \rightarrow i.e. Database
- Its own context, invariants, rules, code!
- IT IS AUTONOMOUS!

Business/Logical Microservices (Bounded Contexts)

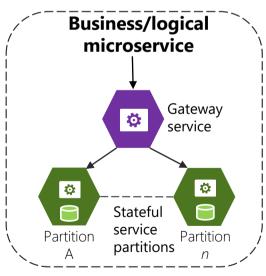

Example 1

Example 2

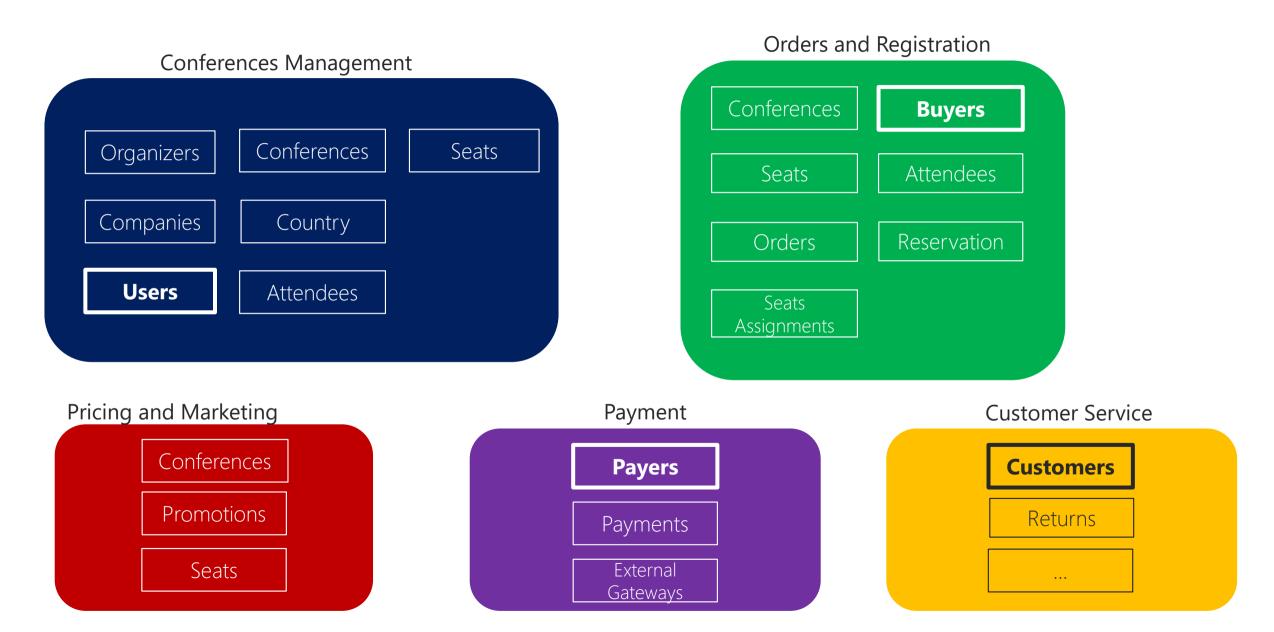

Example 3

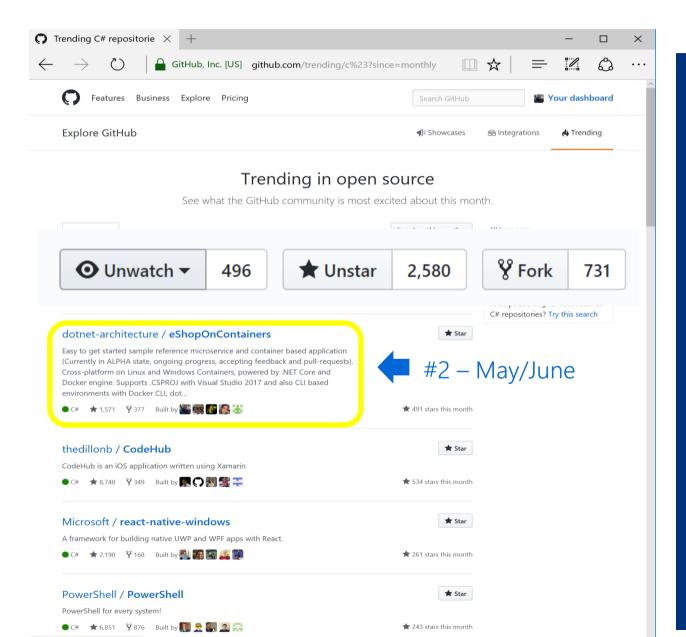

(Using Azure Service Fabric Stateful Reliable Services)

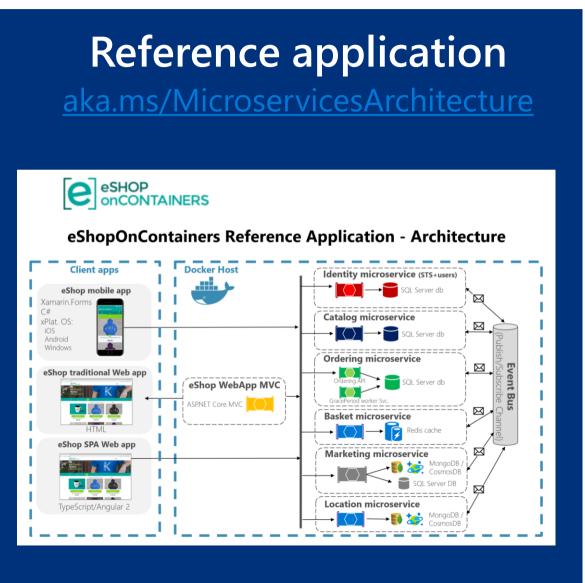

- The Logical Architecture can be different from the Physical/Deployment Architecture
- A Bounded Context can be implemented by 1 or more services (i.e. ASP.NET Web API)

Identifying a Domain Model per Microservice/BoundedContext

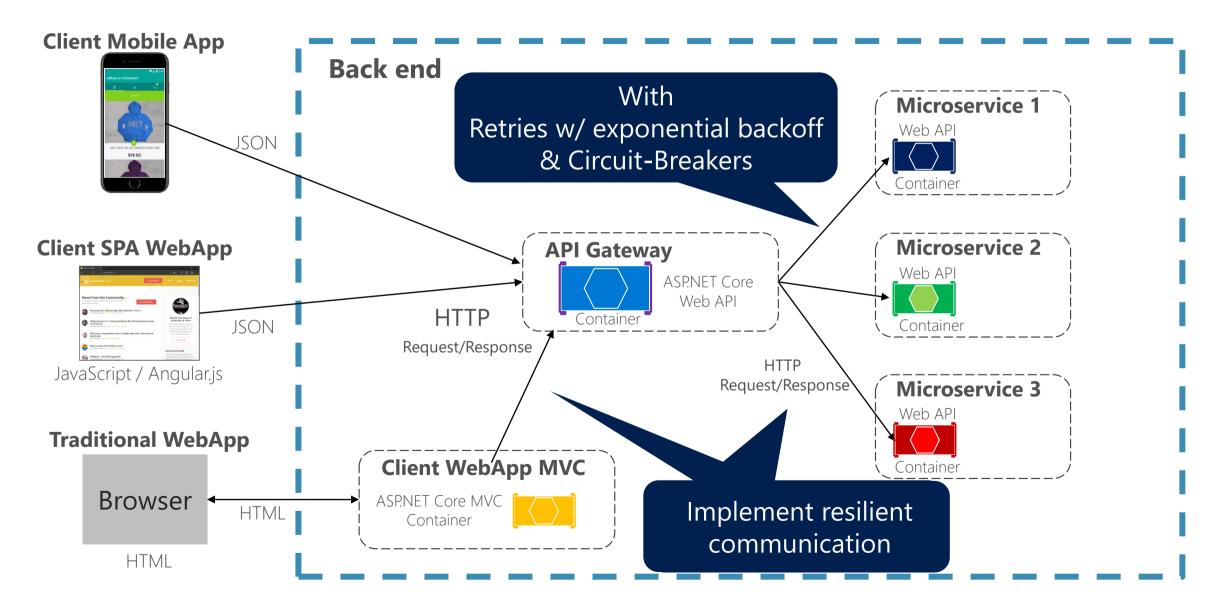

.Net Microservice And Container Guidance

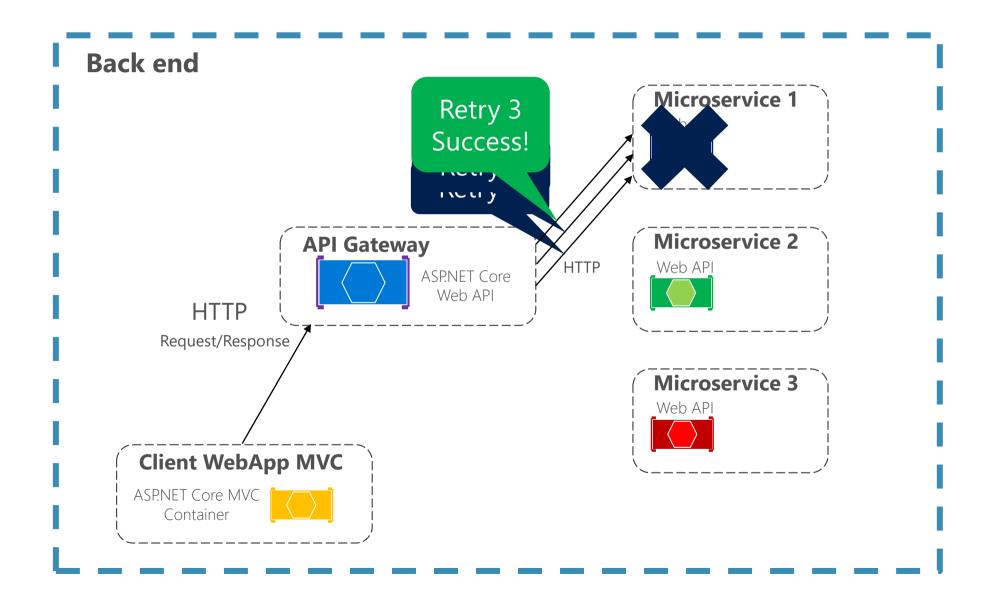

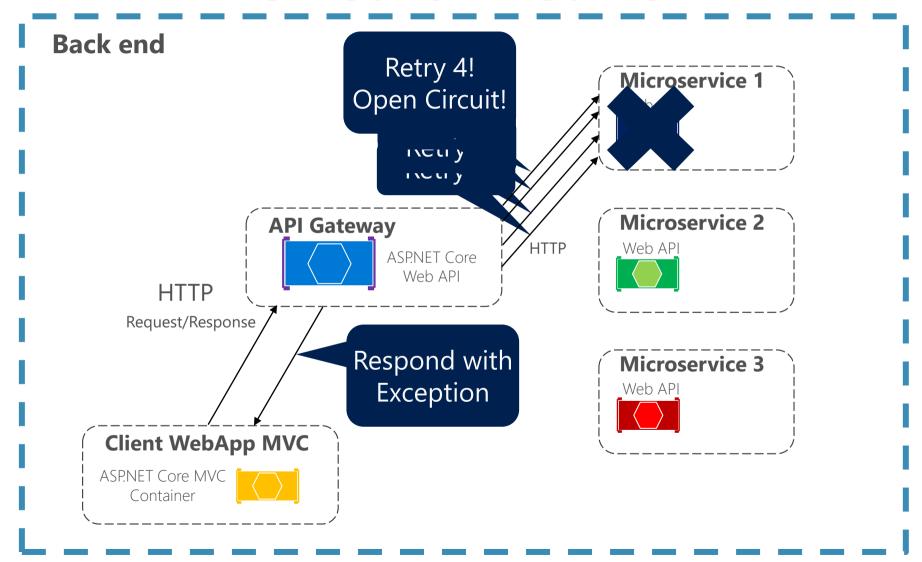

Building Resilient Cloud Applications

Retries with Exponential Backoff

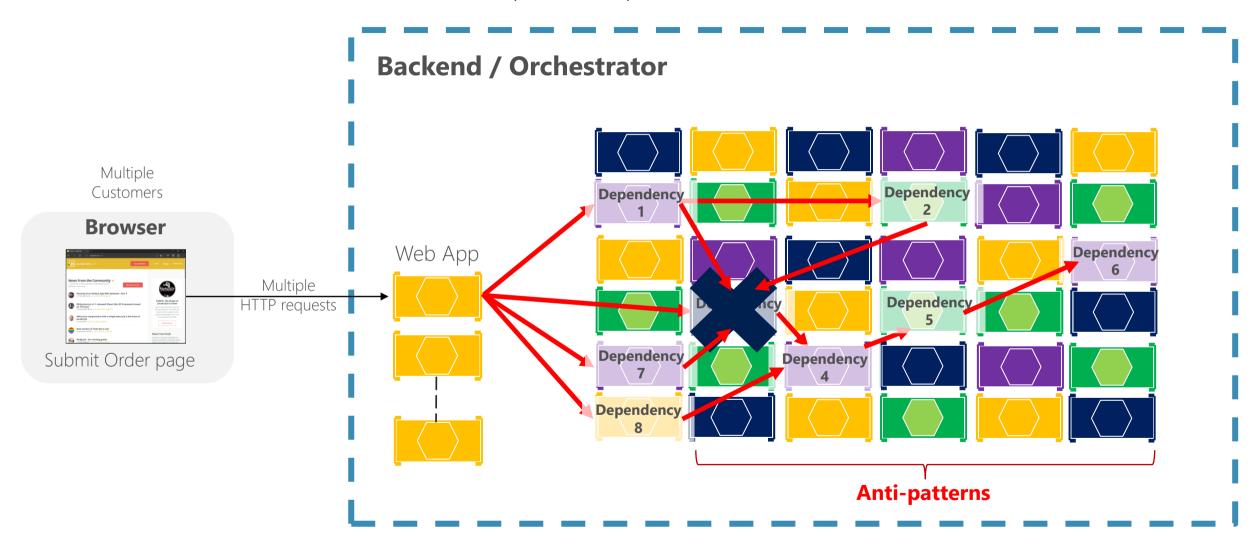

Retries with Exponential Backoff + Circuit Breaker

Risk of Partial Failure Amplified by Microservices

HTTP request/response communication

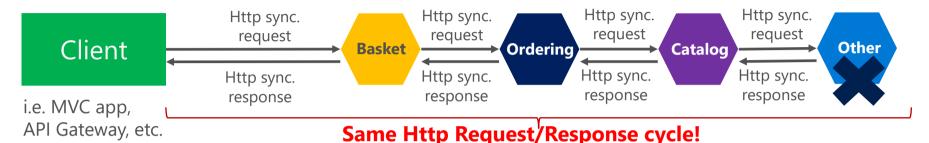

How To Minimize Exponential Failures In Microservices

- Circuit-Breakers
- Avoid long Http call chains within the same request/response cycle

Synchronous vs. Async communication across Microservices

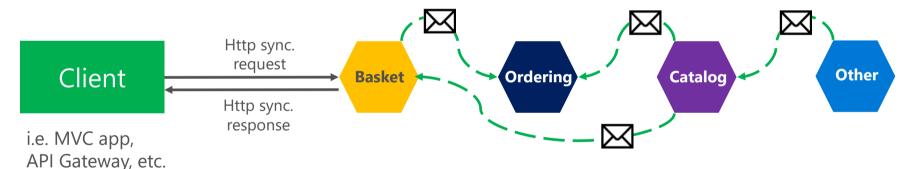

Anti-pattern

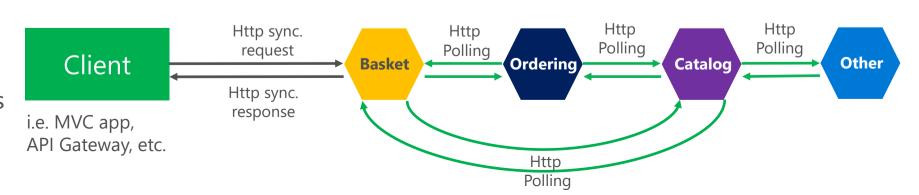

Asynchronous

Comm. across internal microservices (EventBus: i.e. **AMPQ**)

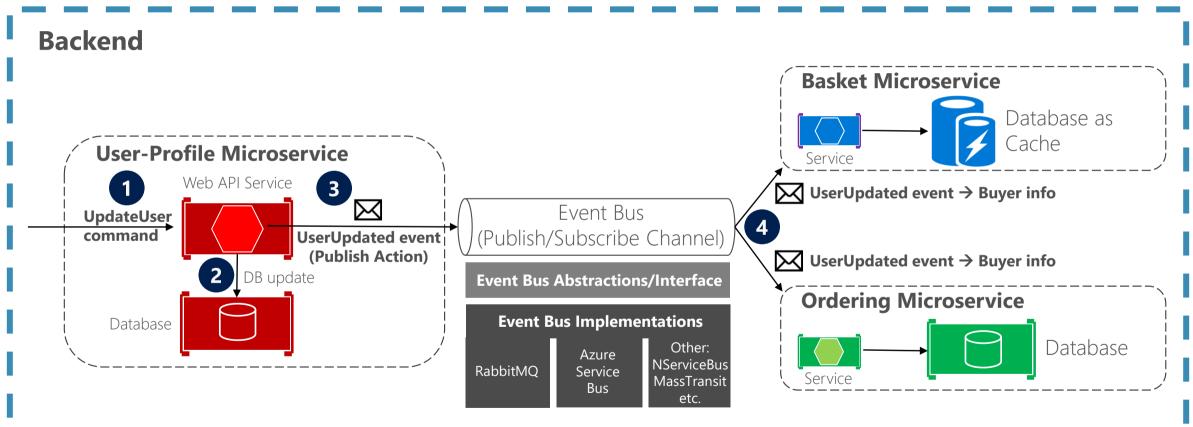

"Asynchronous"

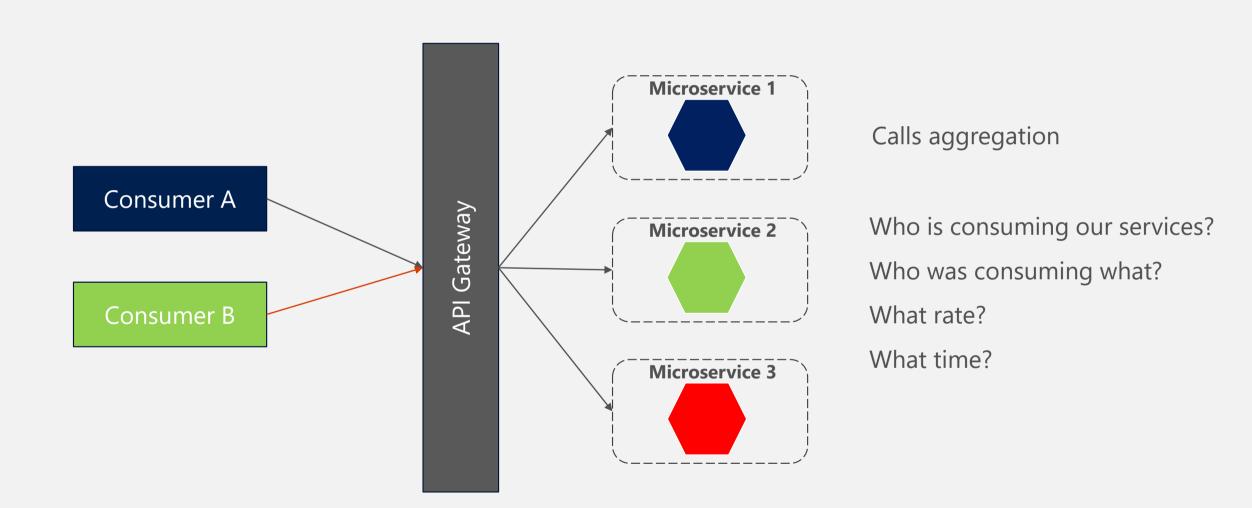

Comm. across internal microservices (Polling: **Http**)

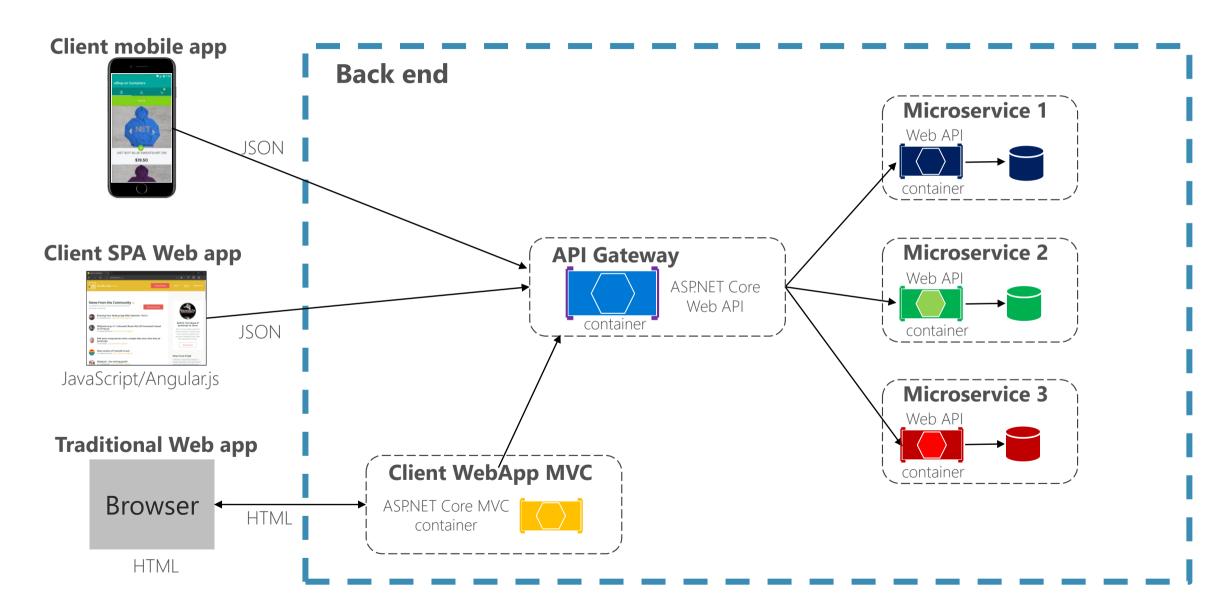

Asynchronous Event-Driven communication with an Event Bus

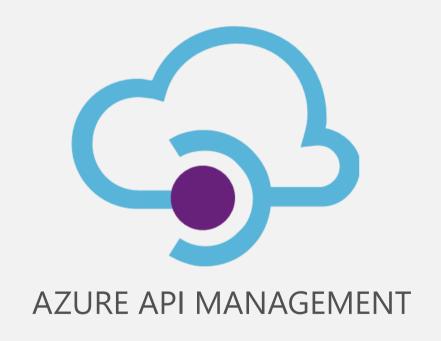

Eventual consistency across microservices' data based on event-driven async communication

Using a custom API Gateway Service

API Gateway "as a service/product"

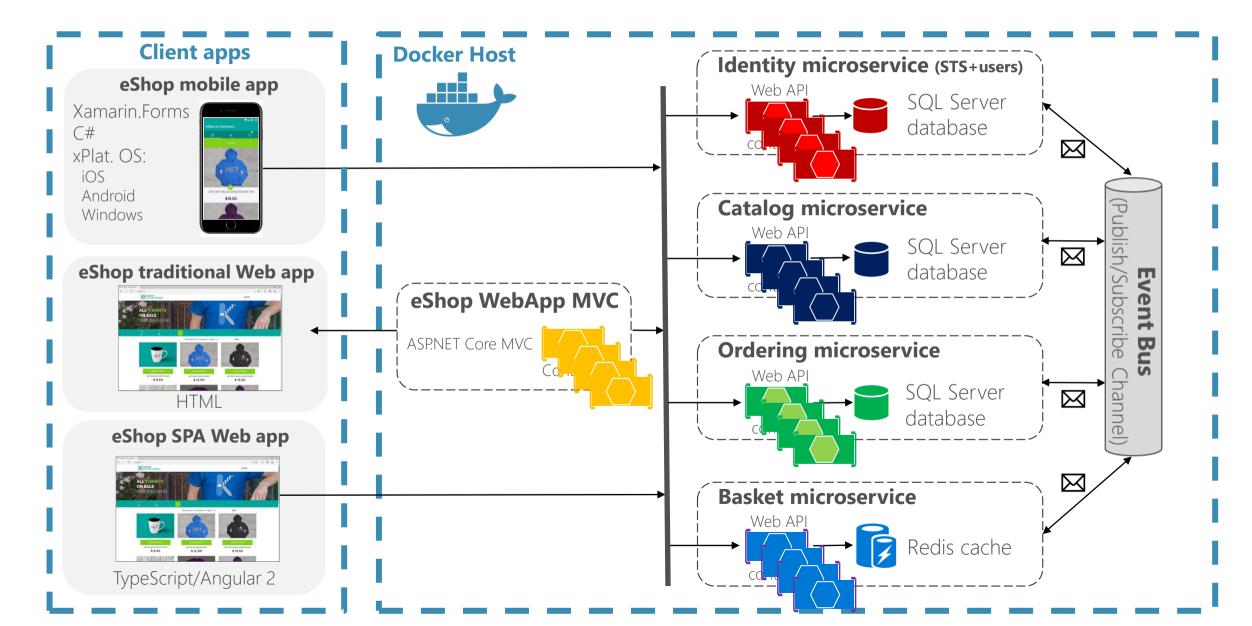

Third parties

Scaling out eShopOncontainers

Demonstration: Building Microservices with Containers

eShopOnContainers
